

Sludge Sampler

*Takes a core sample of the liquid and sludge layer with a unique sealing bottom section.
Sturdier than other samplers.*

The Sludge sampler (aka Sludge Judge!) takes a core sample of the liquid and sludge layer with a unique sealing bottom section. The depth of sludge can clearly be seen trapped in the sturdy transparent sampler. The depth can be immediately measured at a glance by the 1 foot tape measurements on the sampler.

The CorePRO® Sludge sampler is made in 3 sections with treaded connections of sturdy 1-1/2" polycarbonate. Threaded tube connections are made of polypropylene and PVC. The CorePRO® comes with a top section with rope handle, a middle section and a bottom section with a shut-off ball valve that seals when lifted by the weight of the contents. The sections are marked in 1 foot intervals with waterproof tape to measure the sludge captured in sampler. The total length is 15 feet in 3 x 5ft sections.

CorePRO® Sampler

Built-in non-clogging valve holds the sample for blanket observation.
